

Machine Learning Course 2026 Autumn: Experiment 1

September 29, 2026

1 Overview

In this experiment, you will implement linear models, including linear regression, ridge regression, and logistic regression, and evaluate trained models on the test set. You will also compare your implementation with the models in *sklearn*.

2 Dataset Description

The datasets are ready for you and are stored in the files *diabetes_train.csv*, *diabetes_test.csv*, *pendigit_train.csv*, and *pendigit_test.csv*. Each row in the files is a sample, with the last column being the label and the other columns being the features.

3 Task Description

3.1 Task 1

Given the *diabetes* dataset, implement the **linear regression** models for **gradient descent** and **closed-form solution**, and evaluate the trained model on the test set.

3.2 Task 2

Given the *diabetes* dataset, implement the **ridge regression** model with **gradient descent**, and evaluate the trained model on the test set. **5-fold cross-validation** will be employed to select the proper value of the hyperparameter, and the influence of these values on the trained model will be evaluated. In addition, use the **closed-form solution** to construct the **ridge regression** model using the **optimal hyperparameter** obtained by cross-validation.

3.3 Task 3

Given the *pendigit* dataset, implement the **logistic regression** model with **gradient descent**, and evaluate the trained model on the test set.

3.4 Task 4

Compare the trained models with standard models in *sklearn*. Discuss the difference between them and try to analyze the possible reasons.

4 Requirements

- Implement learning algorithms with **Python**. Basic data analysis libraries such as **NumPy**, **Pandas**, **Matplotlib**, etc., are allowed to use.
- For Tasks 1–3, you cannot use highly integrated libraries such as **sklearn**, **PyTorch**, **TensorFlow**, etc. For Task 4 only, you may use **sklearn** for comparison.
- Record the procedure of experiments in **Jupyter Notebook**. It is recommended to use **Markdown** in Notebook to properly explain the procedure.
- Your submission includes:
 - source code: python notebook (*.ipynb*);
 - *report.doc* file: your report. Refer to the report template for the format.
